

1. What is dictionary in Python? Explain with an Eg.

A dictionary is used to map or associate the things you want to store the keys you need to get them. Dictionary are defined into two elements Keys and values. Keys will be a single element. Examples of dictionary:-

di = { "apple": 1, "Mango": 2, "pineapple": 4 }

apple, mango, pineapple are keys 1, 2, 4 are known as values.
